

2W MINERAL FEEDER

Diversifying 2W's offerings comes the 2W Mineral Feeder. Constructed of the same heavy duty materials as the "400, 500, 600" Series products this Mineral Feeder boasts industry leading strength and versatility. Focused on providing a long lasting implement that outperforms any other mineral feeder on the market, whilst also eliminating spillage from rain and cattle prodding the feeder. Every mineral feeder on the market today spills up to 30% of their contents which is coming right out of the pocket of the handlers. 2W was determined to solve this issue with the 2W Mineral Feeder.

MINERAL FEEDERS REVOLUTIONIZED

2W has expanded its livestock equipment line-up to explore new and value-able markets. By taking the durability focused processes found in livestock equipment manufacturing and applying it to a fencing product, 2W has produced a high quality, feature dense, and highly cost competitive mineral feeder for customer's desiring a product that is both easier to use and will last a lifetime.

Did you know every mineral feeder on the market spills up to 30% of its contents? That's money out of YOUR pocket...

MINERAL BUCKET SWAP OR REFILL.

For maximum convenience and easy-of-use, this mineral feeder has a hinged mineral bucket loading mechanism. Simply roll your (up to 220lb) mineral bucket into the loader and give it a good kick back. The hinged assembly will flop the bucket into the frame, and you're done! Optionally you can re-fill the existing bucket with granular mineral feed. No more buckets laying around the yard!

ULTRA-HEAVY DUTY CARRIER FRAME

To say this thing is overbuilt - is a hilarious understatement. Constructed primarily of 2" Diameter High Strength Steel Oval Tube that has been laser cut and precision welded. This feeder uses the same materials as 2W Livestock's Heavy Duty Corral Equipment. If 2W's panels and gates are renown for standing up to use and abuse then the mineral feeders should hold up to the same expectation.

WEATHER RESISTANT RUBBER FLAP

After loading your 220 lb bucket of minerals a few weeks will pass and you may wish to move your mineral feeder! We at 2W prefer to preserve our lower backs for bull riding season so our engineers have designed around this dilemma.

In true Canadian fashion ski-sled inspired skids are incorporated for easy transport behind any vehicle. Hook it up and drag it to wherever you'd like it!

Concerned about damaging the feeder? We DARE you to drag the competition's loaded feeders around the pasture a few times behind the quad. Our raw materials stand up against full-sized bulls!

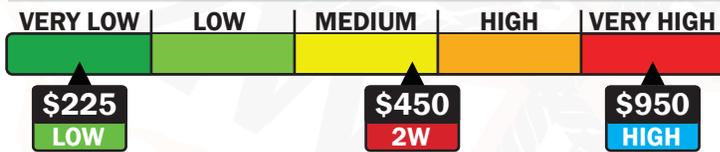

ANCHORED DOWN. ZERO SPILLAGE.

After reaching about half way down the tub cattle tend to get aggressive when trying to reach the bottom of the bucket. Four pin holsters are incorporated into the base of the skids. Depending on ground conditions, small pins or long pins can be used to anchor the feeder. Paired with a high strength rubber flap incorporated to the top this mineral feeder has been tried, tested, and proven to have nearly ZERO spillage - saving YOU money!
